Abstract

This paper gathers results obtained with a software written in Java, accessible on the web-page www.math.sciences.univ-nantes.fr/~chaput/quiver-demo.html. For exceptional minuscule, quasi-minuscule, cominuscule or adjoint homogeneous spaces, the Schubert cells are expressed as polynomials in the generators of the quantum cohomology algebra.

1 Notations

Let us explain our notations. We consider a minuscule, quasi-minuscule, cominuscule or adjoint rational homogeneous space G/P (for the definition of these spaces, see [CP09]), and moreover we assume that G is an exceptional group, namely that its type is one of E_6, E_7, E_8, F_4, G_2 .

Let r denote the rank of G . Let $(\alpha_i)_{1 \leq i \leq r}$ be the basis of the root system of G chosen in [Bou54]. An element $\alpha = a_1\alpha_1 + \cdots + a_r\alpha_r$ of the root lattice will be denoted $(a_1, \dots, a_r)$. Let ϖ be the fundamental weight corresponding to P . The Schubert cells are well-known to be parametrised by the coset W/W_P . We denote each Schubert cell σ_w , with $w \in W/W_P$, with σ_α , where $\alpha = \varpi - w(\varpi)$.

We choose some generators of $H^*(G/P)$ and we give, for each $w \in W/W_P$, an expression of σ_w as a polynomial in these generators in the quantum cohomology algebra (thus the choice we made of the generators is visible in these expressions).
